

## FEATURES

### Dual-mode inclinometer system

Dual-axis, horizontal operation,  $\pm 90^\circ$

Single-axis, vertical operation,  $\pm 180^\circ$

High accuracy,  $0.1^\circ$

Digital inclination data,  $0.025^\circ$  resolution

Digital acceleration data,  $0.244 \text{ mg}$  resolution

$\pm 1.7 \text{ g}$  accelerometer measurement range

Digital temperature sensor output

Digitally controlled bias calibration

Digitally controlled sample rate

Digitally controlled frequency response

Dual alarm settings with rate/threshold limits

Auxiliary digital I/O

Digitally activated self-test

Digitally activated low power mode

SPI-compatible serial interface

Auxiliary 12-bit ADC input and DAC output

Single-supply operation:  $3.0 \text{ V}$  to  $3.6 \text{ V}$

$3500 \text{ g}$  powered shock survivability

## APPLICATIONS

Platform control, stabilization, and alignment

Tilt sensing, inclinometers, leveling

Motion/position measurement

Monitor/alarm devices (security, medical, safety)

Navigation

## GENERAL DESCRIPTION

The **ADIS16209** is a high accuracy, digital inclinometer that accommodates both single-axis ( $\pm 180^\circ$ ) and dual-axis ( $\pm 90^\circ$ ) operation. The standard supply voltage ( $3.3 \text{ V}$ ) and serial peripheral interface (SPI) enable simple integration into most industrial system designs. A simple internal register structure handles all output data and configuration features. This includes access to the following output data: calibrated acceleration, accurate incline angles, power supply, internal temperature, auxiliary analog and digital input signals, diagnostic error flags, and programmable alarm conditions.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

Configurable operating parameters include sample rate, power management, digital filtering, auxiliary analog and digital output, offset/null adjustment, and self-test for sensor mechanical structure.

The **ADIS16209** is available in a  $9.2 \text{ mm} \times 9.2 \text{ mm} \times 3.9 \text{ mm}$  LGA package that operates over a temperature range of  $-40^\circ\text{C}$  to  $+125^\circ\text{C}$ . It can be attached using standard RoHS-compliant solder reflow processes.

			36	42	mA
			140	350	$\mu\text{A}$

<sup>1</sup> Guaranteed by iMEMS® packaged part testing, design, and/or characterization.

<sup>2</sup> Self-test response changes as the square of VDD.

<sup>3</sup> The  $\overline{\text{RST}}$  pin has an internal pull-up.

<sup>4</sup> Guaranteed by design.

<sup>5</sup> The times presented in this section represent the time it takes to start producing data in the output registers, after the minimum VDD reaches 3.0 V. They do not represent the settling time of the internal filters.

Note that for the default SENS\_AVG and AVG\_CNT settings, the typical settling time is ~1.28 seconds. For faster settling times, reduce the AVG\_CNT and SMPL\_PRD settings. Note that the trade-off associated with faster settling times is noise and power.

<sup>6</sup> Endurance is qualified as per JEDEC Standard 22 Method A117 and measured at  $-40^\circ\text{C}$ ,  $+25^\circ\text{C}$ ,  $+85^\circ\text{C}$ , and  $+125^\circ\text{C}$ .

<sup>7</sup> Retention lifetime equivalent at junction temperature ( $T_J$ )  $55^\circ\text{C}$  as per JEDEC Standard 22 Method A117. Retention lifetime decreases with junction temperature.

**TIMING SPECIFICATIONS**

T<sub>A</sub> = 25°C, VDD = 3.3 V, tilt = 0°, unless otherwise noted.

**Table 2.**

Parameter	Description	Min <sup>1</sup>	Typ	Max	Unit
f <sub>SCLK</sub>	Fast mode, SMPL_PRD ≤ 0x07 (f <sub>s</sub> ≥ 546 Hz) <sup>2</sup> Normal mode, SMPL_PRD ≥ 0x08 (f <sub>s</sub> ≤ 482 Hz) <sup>2</sup>	0.01		2.5	MHz
t <sub>DATARATE</sub>	Chip select period, fast mode, SMPL_PRD ≤ 0x07 (f <sub>s</sub> ≥ 546 Hz) <sup>2</sup> Chip select period, normal mode, SMPL_PRD ≥ 0x08 (f <sub>s</sub> ≤ 482 Hz) <sup>2</sup>	32		42	μs

## ABSOLUTE MAXIMUM RATINGS

Table 3.

Parameter	Rating
Acceleration (Any Axis, Unpowered)	3500 <i>g</i>
Acceleration (Any Axis, Powered)	3500 <i>g</i>
VDD to GND	−0.3 V to +7.0 V
Digital Input/Output Voltage to GND	−0.3 V to +5.3 V
Analog Inputs to GND	−0.3 to VDD + 0.3 V
Analog Inputs to GND	−0.3 to VDD + 0.3 V
Operating Temperature Range	−40°C to +125°C
Storage Temperature Range	−65°C to +150°C

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

Table 4. Package Characteristics

Package Type	$\theta_{JA}$	$\theta_{JC}$	Device Weight
16-Terminal LGA	250°C/W	25°C/W	0.6 g

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

# PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

**NOTES**  
 1. DNC = DO NOT CONNECT TO THIS PIN.  
 2. THIS IS NOT AN ACTUAL TOP VIEW, BECAUSE THE PINS ARE NOT VISIBLE FROM THE TOP. THIS IS A LAYOUT VIEW THAT REPRESENTS THE PIN CONFIGURATION IF THE PACKAGE IS LOOKED THROUGH FROM THE TOP. THIS CONFIGURATION IS PROVIDED FOR PCB LAYOUT PURPOSES.

Figure 5. Pin Configuration

Table 5. Pin Function Descriptions

Pin No.	Mnemonic	Type <sup>1</sup>	Description
1	SCLK	I	SPI, Serial Clock.
2	DOUT	O	SPI, Data Output.
3	DIN	I	SPI, Data Input.
4	$\overline{CS}$	I	SPI, Chip Select.
5, 6	DIO1, DIO2	I/O	Digital Input/Output Pins.
7, 8, 10, 11	DNC	N/A	Do not connect to this pin.
9	$\overline{RST}$	I	Reset, Active Low.
12	AUX DAC	O	Auxiliary DAC Output.
13	VDD	S	Power Supply, 3.3 V.
14	AUX ADC	I	Auxiliary ADC Input.
15	VREF	O	Precision Reference.
16	GND	S	Ground.

<sup>1</sup> S = supply; O = output; I = input.

# THEORY OF OPERATION

The ADIS16209 tilt sensing system uses gravity as its only stimulus, and a MEMS accelerometer as its sensing element. MEMS accelerometers typically employ a tiny, spring-loaded structure that is interlaced with a fixed pick-off finger structure. The spring constant of the floating structure determines how far it moves when subjected to a force. This structure responds to dynamic forces associated with acceleration and to static forces, such as gravity.

Figure 16 and Figure 17 illustrate how the accelerometer responds to gravity, according to its orientation, with respect to gravity. Figure 16 displays the configuration for the incline angle outputs, and Figure 17 displays the configuration used for the rotational angle position. This configuration provides greater measurement range than a single axis. The ADIS16209 incorporates the signal processing circuit that converts acceleration into an incline angle, and it corrects for several known error sources that would otherwise degrade the accuracy level.

NOTES  
 1. ROT\_OUT = 180° IS 1 LSB DIFFERENT THAN ROT\_OUT = -179.975°.

Figure 19. Vertical Angle Orientation

## BASIC OPERATION

The ADIS16209 requires only power/ground and SPI connections. The SPI is simple to hook up and is supported by many common digital hardware platforms. Figure 20 provides a simple hook-up diagram, while Table 2, Figure 2, and Figure 3 provide timing and bit assignments. Figure 4 provides the bit sequence for accessing the register memory structure. Each function within the ADIS16209 has its own 16-bit, 2-byte register. Each byte has its own unique 7-bit address. Note that all 16 SCLK cycles are required for the DIN bit sequence to configure the output for the next data frame. The ADIS16209 supports full duplex mode operation. Table 6 provides the entire user register map for the ADIS16209. For each register, the lower bytes address is given. For those registers that have two bytes, the upper bytes address is simply the lower bytes address, incremented by 0x01.

Figure 20. Typical SPI Hook-Up

Many of the configuration registers have also been assigned mirror locations in the flash memory, which effectively provide them with a backup storage function. To ensure the backup of these registers, the COMMAND register provides an initiation bit for manual flash updates. The ENDURANCE register provides a running count of these events.

Table 6. User Register Map

Name	R/W	Flash Backup	Address	Size (Bytes)	Function	Reference
ENDURANCE	R	Yes	0x00	2	Diagnostics, flash write counter (16-bit binary)

**OUTPUT DATA REGISTERS**

Table 7 provides the data configuration for each output data register in the ADIS16209. Starting with the MSB of the upper byte, each output data register has the following bit sequence: new data (ND) flag, error/alarm (EA) flag, followed by 14 data bits. The data bits are LSB justified, and in the case of the 12-bit data formats, the remaining two bits are not used. The ND flag indicates that unread data resides in the output data registers. This flag clears and returns to 0 during an output register read sequence. It returns to 1 after the next internal sample update cycle completes. The EA flag indicates an error condition. The STATUS register contains all of the error flags and provides the ability to investigate the root cause.

**Table 7. Output Data Register Formats**

Register	Bits	Format	Scale <sup>1</sup>
SUPPLY_OUT	14	Binary, 3.3 V = 0x2A3D	0.30518 mV
XACCL_OUT	14	Twos complement	0.24414 mg
YACCL_OUT	14	Twos complement	0.24414 mg
AUX_ADC	12	Binary, 2 V = 0x0CCC	0.6105 mV
TEMP_OUT	12	Binary, 25°C = 0x04FE	-0.47°C
XINCL_OUT <sup>2</sup>	14	Twos complement	0.025°
YINCL_OUT <sup>2</sup>	14	Twos complement	0.025°
ROT_OUT <sup>3</sup>	14	Twos complement	0.025°

<sup>1</sup> Scale denotes quantity per LSB.

<sup>2</sup> Range is -90° to +90°.

<sup>3</sup> Range is -179.975° to +180°.

**Accelerometers**

The accelerometers respond to both static (gravity) and dynamic acceleration using the polarity shown in Figure 21.

Figure 21. Accelerometer Polarity

07096-024

The XACCL\_OUT (see Table 8) and YACCL\_OUT (see Table 9) registers provide access to acceleration data for each axis. For example, set DIN = 0x0400 to request data from the x-axis register on the next 16-bit SPI sequence. After reading the contents of one of these registers, mask off the upper two bits, convert the remaining 14-bit, twos complement number into a decimal equivalent, and then multiply that number by 0.024414 to convert the measurement into units of acceleration (mg). Table 10 provides several examples of this data format.

**Table 8. XACCL\_OUT (Base Address = 0x04), Read Only**

Bits	Description
15	New data bit = 1, when register contains un-read data
14	Error/alarm = 1, when STATUS ≠ 0x0000
[13:0]	x-axis accelerometer output data, twos complement, 1 LSB = 0.24414 mg, 0 g = 0x0000

**Table 9. YACCL\_OUT (Base Address = 0x06), Read Only**

Bits	Description
15	New data bit = 1, when register contains un-read data
14	Error/alarm = 1, when STATUS ≠ 0x0000
[13:0]	y-axis accelerometer output data, twos complement, 1 LSB = 0.24414 mg, 0 g = 0x0000

**Table 10. Accelerometer Data Format Examples**

Acceleration (g)	Decimal	Hex	Binary
+1.7	+6,963	0x1B33	xx01 1011 0011 0011
+1.0	+4,096	0x1000	xx01 0000 0000 0000

0	0	0x0000	xx00 0000 0000 0000
-0.00024414	-1	0x3FFF	xx11 1111 1111 1111
-0.00048828	-2	0xFFFE	xx11 1111 1111 1110
-1.0	-4096	0x3000	xx11 0000 0000 0000
-1.7	-27,853	0xE4CD	xx10 0100 1100 1101

### Horizontal Incline Angle

The XINCL\_OUT (see Table 11) and YINCL\_OUT (see Table 12) registers provide access to acceleration data for each axis. For example, set DIN = 0x0400 to request data from the x-axis register on the next 16-bit SPI sequence. After reading the contents of one of these registers, mask off the upper two bits, convert the remaining 14-bit, twos complement number into a decimal equivalent, and then multiply that number by 0.025 to convert the measurement into units of angle (°).

Table 13 provides several examples of this data format.

**Table 11. XINCL\_OUT (Base Address = 0x0C), Read Only**

Bits	Description
15	New data bit = 1, when register contains un-read data
14	Error/alarm = 1, when STATUS ≠ 0x0000
[13:0]	x-axis inclinometer output data, twos complement, 0° = 0x0000, 1 LSB = 0.025°/LSB, ±90° range

**Table 12. YINCL\_OUT (Base Address = 0x0E), Read Only**

Bits	Description
15	New data bit = 1, when register contains un-read data
14	Error/alarm = 1, when STATUS ≠ 0x0000
[13:0]	y-axis inclinometer output data, twos complement, 0° = 0x0000, 1 LSB = 0.025°/LSB, ±90° range

**Table 13. Horizontal Incline Angle Data Format Examples**

Orientation	Decimal	Hex	Binary
+90° – 0.025°	+3,599	0x0E0F	0000 1110 0000 1111
+0.05°	+2	0x0002	xx00 0000 0000 0010
+0.025°	+1	0x0001	xx00 0000 0000 0001
0°	0	0x0000	xx00 0000 0000 0000
–0.025°	–1	0x3FFF	xx11 1111 1111 1111

### Vertical Incline Angle

The ROT\_OUT register (see Table 14) provides access to incline angle data for each axis. For example, set DIN = 0x1000 to request data from this register on the next 16-bit SPI sequence. After reading the contents of one of these registers, mask off the upper two bits, convert the remaining 14-bit, twos complement number into a decimal equivalent, and then multiply that number by 0.025 to convert the measurement into units of angle (°). Table 15 provides several examples of this data format.

**Table 14. ROT\_OUT (Base Address = 0x10), Read Only**

Bits	Description
15	New data bit = 1, when register contains un-read data
14	Error/alarm = 1, when STATUS ≠ 0x0000
[13:0]	Vertical inclinometer output data, twos complement, 0° = 0x0000, 1 LSB = 0.025°/LSB, ±180° range

**Table 15. Vertical Incline Angle Data Format Examples**

Orientation	Decimal	Hex	Binary
+180° – 0.025°	+7,199	0x1C1F	xx01 1100 0001 1111
+0.05°	+2	0x0002	xx00 0000 0000 0010
+0.025°	+1	0x0001	xx00 0000 0000 0001
0°	0	0x0000	xx00 0000 0000 0000

–180°	–7,200	0x23E0	xx10 0011 1110 0000

### Internal Temperature

The TEMP\_OUT register (see Table 16) provides access to an internal temperature measurement. Set DIN = 0x0A00 to request the contents of this register. Mask off the upper four bits, then convert the remaining 12-bit binary number into a decimal equivalent, subtract 1278, multiply it by –0.47 and add 25 to convert this number into °C. See Table 17 for examples of this format. Note that this internal temperature measurement provides an indicator of condition changes, not an absolute measurement of conditions outside of the package.

**Table 16. TEMP\_OUT (Base Address = 0x0A), Read Only**

Bits	Description
[15:0]	Internal temperature data, binary format, sensitivity = –0.47°/LSB, 25°C = 1278 LSB = 0x04FE

**Table 17. Internal Temperature Data Format Examples**

Temperature (°C)	LSB	Hex	Binary
+125	1065	0x0429	xxxx 0100 0010 1001
25 + 0.47	1277	0x04FD	xxxx 0100 1111 1101

–40	1416	0x0588	xxxx 0101 1000 1000

### Power Supply

The SUPPLY\_OUT register (see Table 18) provides a digital measurement for the supply voltage on the VDD pins (see Figure 5). Set DIN = 0x0200 to request the contents of this register. See Table 19 for examples of this data format.

**Table 18. SUPPLY\_OUT (Base Address = 0x02), Read Only**

Bits	Description
15	New data bit = 1, when register contains un-read data
14	Error/alarm = 1, when STATUS ≠ 0x0000
[15:0]	Power supply measurement data, binary format, 1 LSB = 0.00030518 V, 0 V = 0x0000

**Table 19. Power Supply Data Format Examples**

3.0	9,830	0x2666	xx10 0110 0110 0110

## Auxiliary ADC

The AUX\_ADC register (see Table 20) provides a digital measurement for the AUX\_ADC input pin (see Figure 5). Set DIN = 0x0800 to request the contents of this register. See Table 21 for examples of this data format.

**Table 20. AUX\_ADC (Base Address = 0x08), Read Only**

Bits	Description

## OPERATION CONTROL REGISTERS

### Internal Sample Rate

The SMPL\_PRD register controls the ADIS16209 internal sample rate and has two parts: a selectable time base and a multiplier. The following relationship produces the sample rate:

$$t_s = t_B \times N_s + 122.07 \mu\text{s}$$

**Table 22. SMPL\_PRD Bit Descriptions**

Bit	Description	(Default = 0x0014)
15:8	Not used	
7	Time base ( $t_B$ ): 0 = 244.14 $\mu\text{s}$ , 1 = 7.568 ms	
6:0	Increment setting ( $N_s$ )	

An example calculation of the default sample period follows:

$$SMPL\_PRD = 0x01, B7 - B0 = 00000001$$

$$B7 = 0 \rightarrow t_B = 244.14 \mu\text{s}, B6 \dots B0 = 00000001 \rightarrow N_s = 1$$

$$t_s = t_B \times N_s + 122.07 \mu\text{s} = 244.14 \times 1 + 122.07 = 366.21 \mu\text{s}$$

$$f_s = 1/t_s = 2731 \text{ SPS}$$

The sample rate setting has a direct impact on the SPI data rate capability. For sample rates  $\geq 546$  SPS, the SPI SCLK can run at a rate up to 2.5 MHz. For sample rates  $< 546$  SPS, the SPI SCLK can run at a rate up to 1 MHz. The sample rate setting also affects power dissipation. When the sample rate is set to  $< 546$  SPS, power dissipation typically reduces by a factor of 68%. The two different modes of operation offer a system-level trade-off between performance (sample rate, serial transfer rate) and power dissipation.

### Power Management

In addition to offering two different performance modes for power optimization, the ADIS16209 offers a programmable shutdown period that the SLP\_CNT register controls.

**Table 23. SLP\_CNT Bit Descriptions**

Bit	Description	(Default = 0x0000)
15:8	Not used	
7:0	Data bits, 0.5 seconds/LSB	

For example, writing 0x08 to the SLP\_CNT register places the ADIS16209 into sleep mode for 4 sec. The only way to stop this process is to remove power or reset the device.

### Digital Filtering

The AVG\_CNT register controls the moving average digital filter, which determines the size of the moving average filter in eight power-of-two step sizes (that is,  $2^M = 1, 2, 4, 16, 32, 64, 128,$  and  $256$ ). Filter setup requires one simple step: write the appropriate M factor to the assigned bits in the AVG\_CNT register. Note that the default settings for AVG\_CNT and SMPL\_PRD provide the best accuracy but require approximately 1.28 seconds to settle.

**Table 24. AVG\_CNT Bit Descriptions**

Bit	Description	(Default = 0x0008)
15:4	Not used	
3:0	Power-of-two step size, maximum binary value = 1000	

The following equation offers a frequency response relationship for this filter:

$$H_A(f) = \frac{\sin(\pi \times N \times f \times t_s)}{N \times \sin(\pi \times f \times t_s)}$$

Figure 22. Frequency Response—Moving Average Filter

### Digital I/O Lines

The ADIS16209 provides two general-purpose, digital input/output lines that have several configuration options.

**Table 25. Digital I/O Line Configuration Registers**

Function	Priority	Register
Data-Ready I/O Indicator	1	MSC_CTRL
Alarm Indicator	2	ALM_CTRL
General-Purpose I/O Configuration	3	GPIO_CTRL
General-Purpose I/O Line Communication		GPIO_CTRL

### Data-Ready I/O Indicator

The MSC\_CTRL register provides controls for a data-ready function. For example, writing 0x05 to this register enables this function and establishes DIO2 as an active-low, data-ready line. The duty cycle is 25% ( $\pm 10\%$  tolerance).

**Table 26. MSC\_CTRL Bit Descriptions**

Bit	Description	(Default = 0x0000)
15:11	Not used	
10	Self-test at power-on: 1 = disabled, 0 = enabled	
9	Not used	
8	Self-test enable: 1 = enabled, 0 = disabled	
7:3	Not used	
2	Data-ready enable: 1 = enabled, 0 = disabled	
1	Data-ready polarity: 1 = active high, 0 = active low	
0	Data-ready line select: 1 = DIO2, 0 = DIO1	

### Self-Test

The self-test function applies an electrostatic force to the MEMS structure, inside of the core sensor, which causes the structure to move in a manner that simulates its response to gravity or linear acceleration. This provides an observable response in the accelerometer outputs that can serve as a validation of functional operation throughout the entire signal chain. The MSC\_CTRL register (Table 29) provides two different options for using this function: manual (user-command) and automatic (during start-up/reset recovery).

The manual self-test control is an on/off control for the electrostatic force. Set MSC\_CTRL[8] = 1 to turn it on and set MSC\_CTRL[8] = 0 to turn it off. For normal operation, this will be in the off state but this control bit provides an opportunity to activate it at any time, so that system processors can apply application-relevant pass/fail criteria to the responses. When MSC\_CTRL[10] = 1, the automatic self-test process runs during the power-on process. This runs the ADIS16209 through on/off states for the self-test, while observing the difference in accelerometer response. This process concludes with a comparison of the differential response in each accelerometer, with internal pass/fail limits and a report of the result to STATUS[5]. Once the ADIS16209 completes its start-up process, STATUS is available for a SPI-driven read, using DIN = 0x3C00 as the SPI input command (STATUS at Address 0x3C).

Linear motion during the start-up process, VDD ramp rates/waveform and the tilt of the device can introduce uncertainty into the on/off levels and in some cases, cause a false failure report to STATUS[5] (result = 0x0020). While the selection of the pass/fail limits incorporates most conditions, false failures are still possible

When presented with a self-test failure indication, where STATUS  $\geq$  0x0020, use the following process to test for basic function. This process assumes a stable power supply voltage and zero motion.

1. Set AVG\_CNT = 0x0000 and SMPL\_PRD = 0x0008, to optimize the response times during the self-test transitions, while keeping the ADIS16209 in low power mode. In this configuration, the self-test response will be similar to a step response of a single-pole, low-pass filter that has a cutoff frequency of 50 Hz.
2. Read XACCL\_OUT and YACCL\_OUT.
3. Set MSC\_CTRL[8] = 1.
4. Delay > 20 ms, which provides the 50 Hz filter (internal to ADIS16209) with at least six time constants to settle.
5. Read XACCL\_OUT and YACCL\_OUT.
6. Calculate difference in measurements:
  - D-XACCL\_OUT = XACCL\_OUT (Step 6) – XACCL\_OUT (Step 3)
  - D-YACCL\_OUT = YACCL\_OUT (Step 6) – YACCL\_OUT (Step 3)
7. Set MSC\_CTRL[8] = 0.
8. Restore the SMPL\_PRD and AVG\_CNT registers to their operational values.
9. Determine normal operation by making sure that the D-XACCL\_OUT and D-YACCL\_OUT produced a change of at least 350 LSB.

The 350 LSB pass/fail limit is approximately one-half of the data sheet specification for the minimum response time and is well above the noise floor. Because the purpose of this function is to identify gross functional issues, such as a zero response, this is a safe approach, given a stable platform and supply. When experiencing modest motion, some of the parameters may need further consideration to account for application-specific conditions.

### General-Purpose I/O

The GPIO\_CTRL register controls the direction and data of the general-purpose digital lines, DIO1 and DIO2. For example, writing a 0x02 to the GPIO\_CTRL register sets DIO2 as an output line and DIO1 as an input line. Reading the data bits in GPIO\_CTRL reveals the line logic level.

**Table 27. GPIO\_CTRL Bit Descriptions**

Bit	Description	(Default = 0x0000)
15:10	Not used	
9	General-Purpose I/O Line 2 data	
8	General-Purpose I/O Line 1 data	
7:2	Not used	
1	General-Purpose I/O Line 2, data direction control: 1 = output, 0 = input	
0	General-Purpose I/O Line 1, data direction control: 1 = output, 0 = input	

### Auxiliary DAC

The auxiliary DAC provides a 12-bit level adjustment function. The AUX\_DAC register controls the operation of the auxiliary DAC function, which is useful for systems that require analog level controls. It offers a rail-to-rail buffered output that has a range of 0 V to 2.5 V. The DAC can drive its output to within 5 mV of the ground reference when it is not sinking current. As the output approaches ground, the linearity begins to degrade (100 LSB beginning point). As the sink current increases, the nonlinear range increases. The DAC output latch function, contained in the COMMAND register, provides continuous operation while writing to each byte of this register. The contents of this register are volatile, which means that the desired output level must be set after every reset and power cycle event.

**Table 28. AUX\_DAC Bit Descriptions**

Bit	Description	(Default = 0x0000)
15:12	Not used	
11:0	Data bits, scale factor = 0.6105 mV/code Offset binary format, 0 V = 0 codes	

### Global Commands

The COMMAND register provides initiation bits for several commands that simplify many common operations. Writing a 1 to the assigned COMMAND bit exercises its function.

**Table 29. COMMAND Bit Descriptions**

Bit	Description	(Default = 0x0000)
15:8	Not used	
7	Software reset	
6:5	Not used	
4	Clear status register (reset all bits to 0)	
3	Flash update; backs up all registers, see Table 6	
2	DAC data latch	
1	Factory calibration restore	
0	Autonull	

The software reset command restarts the internal processor, which loads all registers with the contents in their flash memory locations.

The flash update copies the contents of all the flash backup registers into their assigned, nonvolatile flash memory locations. This process takes approximately 50 ms and requires a power supply that is within the specified operating range. After waiting the appropriate time for the flash update to complete, verify successful completion by reading the STATUS register (if successful, the flash update error is 0). If the flash update was not successful, reading this error bit accomplishes two things: it alerts the system processor to try again, and it clears the error flag, which is required for flash memory access.

The DAC data latch command loads the contents of AUX\_DAC into the DAC latches. Because the AUX\_DAC contents must be updated one byte at a time, this command ensures a stable DAC output voltage during updates.

The autonull command provides a simple method for removing offset from the sensor outputs by taking the contents of the output data registers and loading the equal but opposite number into the offset calibration registers.

To accomplish this, the autonull command executes the following operations:

1. Read the XACCL\_OUT, YACCL\_OUT, XINCL\_OUT, YINCL\_OUT, and ROT\_OUT values.
2. Change the polarity of these measurements.
3. Write the results to the XACCL\_NULL, YACCL\_NULL, XINCL\_NULL, YINCL\_NULL, and ROT\_NULL registers.
4. Perform a manual backup of all user registers, using the flash memory bank.

When using the horizontal incline angle measurements (XINCL\_OUT and YINCL\_OUT), the autonull helps remove bias errors in the accelerometers, as well as orientation error, with respect to the horizontal plane (0 g). When using the vertical incline measurement (ROT\_OUT), do not use the autonull function.

The accuracy of this operation depends on stable inertial conditions (zero acceleration or change in orientation, with respect to gravity) and optimal noise management during the measurement (see the Digital Filtering section).

The factory calibration restore command sets the offset null registers (XACCL\_NULL, for example) back to their default values.

## CALIBRATION REGISTERS

The ADIS16209 incorporates an extensive factory calibration and provides precision acceleration, incline, and rotational position data. For systems that require on-site calibration, user-programmable offset adjustment registers are available.

Table 30 provides the bit assignments for the following user-programmable calibration registers: XACCL\_NULL and YACCL\_NULL. Table 31 provides the bit assignments for the following user-programmable calibration registers: XINCL\_NULL, YINCL\_NULL, and ROT\_NULL.

**Table 30. Acceleration Offset Register Bit Designations**

Bit	Description	(Default = 0x0000)
15:14	Not used	
13:0	Data bits, twos complement, sensitivity = 0.24414 mg/LSB	

**Table 31. Incline/Rotation Offset Register Bit Designations**

Bit	Description	(Default = 0x0000)
15:14	Not used	
13:0	Data bits, twos complement, sensitivity = 0.025°/LSB	

## ALARM REGISTERS

The alarm function provides monitoring for two independent conditions. The ALM\_CTRL register provides control inputs for data source, data filtering (prior to comparison), static/dynamic, and output indicator configurations. The ALM\_MAGx registers establish the trigger threshold and polarity configurations. The ALM\_SMPLx registers provide the numbers of samples to use in the dynamic rate-of-change configuration. The rate-of-change calculation is

$$Y_C = \frac{1}{N_{DS}} \sum_{n=1}^{N_{DS}} y(n+1) - y(n) \Rightarrow Alarm \Rightarrow is Y_C > or < M_C ?$$

where:

$N_{DS}$  is the number of samples in ALM\_SMPLx.

$y(n)$  is the sampled output data.

$M_C$  is the magnitude for comparison in ALM\_MAGx.

> or < is determined by the MSB in ALM\_MAGx.

**Table 32. ALM\_MAG1/ALM\_MAG2 Bit Designations**

Bit	Description	(Default = 0x0000)
15	Comparison polarity: 1 = greater than, 0 = less than	
14	Not used	
13:0	Data bits, matches format of trigger source selection	

**Table 33. ALM\_SMPL1/ALM\_SMPL2 Bit Designations**

Bit	Description	(Default = 0x0001)
15:8	Not used	
7:0	Data bits: number of samples (both 0x00 and 0x01 = 1)	

**Table 34. ALM\_CTRL Bit Descriptions**

Bit	Value	Description	(Default = 0x0000)
15:12		Trigger source, Alarm 2	
	0000	Disabled	
	0001	Power supply	
	0010	X-acceleration	
	0011	Y-acceleration	
	0100	Auxiliary ADC	
	0101	Temperature sensor	
	0110	X-axis incline angle	
	0111	Y-axis incline angle	
	1000	Rotational position	
11:8		Trigger source, Alarm 1, same as Bits[15:12]	
7		Not used	
6		Alarm 2 rate-of-change control: 1 = enabled	
5		Alarm 1 rate-of-change control: 1 = enabled	
4		Alarm 2 filter: 1 = filtered data, 0 = no filter <sup>1</sup>	
3		Alarm 1 filter: 1 = filtered data, 0 = no filter <sup>1</sup>	
2		Alarm indicator, using DIO1/DIO2: 1 = enabled	
1		Alarm indicator polarity: 1 = active high	
0		Alarm indicator line select: 1 = DIO2, 0 = DIO1	

<sup>1</sup> Incline and vertical angles always use filtered data in this comparison.

**Status**

The STATUS register provides a series of error flags that provide indicator functions for common system-level issues. After reading the contents of this register, set COMMAND[4] = 1 (DIN = 0xBE10) to reset all of its flags to zero.

**Table 35. STATUS Bit Descriptions**

<b>Bit</b>	<b>Description</b>	<b>(Default = 0x0000)</b>

4	Not used	
3	SPI communications failure: 1 = error condition, 0 = normal operation	
2	Flash update failed: 1 = error condition, 0 = normal operation	
1	Power supply greater than 3.625 V: 1 > 3.625 V, 0 ≤ 3.625 V (normal)	
0	Power supply less than 2.975 V: 1 < 2.975 V, 0 ≥ 2.975 V (normal)	

## APPLICATIONS INFORMATION

### POWER SUPPLY CONSIDERATIONS

The [ADIS16209](#) is a precision sensing system that uses an embedded processor for critical interface and signal processing functions. Supporting this processor requires a low impedance power supply, which can manage transient current demands that happen during normal operation, as well as during the start-up process. Transient current demands start when the voltage on the VDD pin reaches ~2.1 V; therefore, it is important for the voltage on the VDD pin to reach 3 V as quickly as possible. Linear VDD ramp profiles that reach 3 V in 100  $\mu$ s provide reliable results when used in conjunction with design practices that support low dynamic source impedance. The [ADP1712](#) is a linear regulator that can support the recommended ramp profile. See the [ADIS1620x/21x/22x Power Regulator Suggestion](#) page for a reference design for using this regulator with the [ADIS16209](#).

#### Power-On-Reset Function

The [ADIS16209](#) has a power-on-reset (POR) function that triggers a reset if the voltage on the VDD pin fails to transition between 2.35 V and 2.7 V within 128 ms.

#### Transient Current from VDD Ramp Rate

Because the [ADIS16209](#) contains 2  $\mu$ F of decoupling capacitance on VDD and some systems may use additional filtering capacitance, the VDD ramp rate will have a direct impact on initial transient current requirements. Use this formula to estimate the transient current, associated with a particular capacitance (C) and VDD ramp rate (dV/dt).

$$i(t) = C \frac{dV}{dt}$$

For example, if VDD transitions from 0 V to +3.3 V in 33  $\mu$ s, dV/dt is equal to 100000V/S (3.3 V/33  $\mu$ s). When charging the internal 2  $\mu$ F capacitor (no external capacitance), the charging current for this ramps rate is 200 mA, during the 33  $\mu$ s ramp time. This relationship provides a tool for evaluating the initial charging currents against the current limit thresholds of system power supplies, which can cause power supply interruptions and the appearance of failed start-ups. This may also be important for maintaining surge current ratings of any series elements as well

#### Filter Settling

The SMPL\_PRD and AVG\_CNT settings have a direct impact on the filter settling during turn-on. For example, when using the default settings for these filters, the SUPPLY\_OUT register takes approximately 1.28 seconds to settle. During this time, the SUPPLY\_OUT register experiences a linear rise (assuming that VDD is stable and greater than 3.0 V) and the low-voltage flag (STATUS[0]) is low. When the SUPPLY\_OUT register reaches a value that exceeds 2.975 V, the STATUS[0] flag automatically lowers.

#### ASSEMBLY

When developing a process flow for installing [ADIS16209](#) devices on PCBs, see the JEDEC standard document J-STD-020C for reflow temperature profile and processing information. The [ADIS16209](#) can use the Sn-Pb eutectic process and the Pb-free eutectic process from this standard, with one exception: the peak temperature exposure is 240°C. For a more complete list of assembly process suggestion, see the [ADIS162xx LGA Assembly Guidelines](#) page at the Engineer Zone/MEMS Community website. Figure 23 provides an example pad layout for the location of the [ADIS16209](#) on a printed circuit board (PCB).

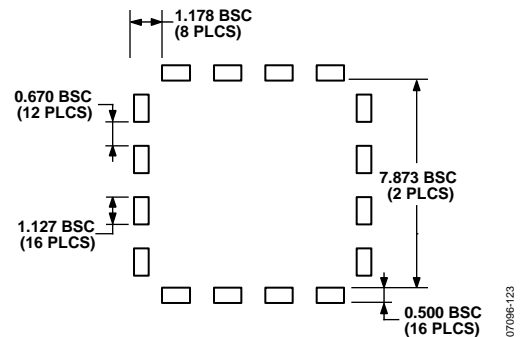

Figure 23. Example Pad Layout

## INTERFACE BOARD

The **ADIS16209/PCBZ** provides the **ADIS16209** function on a 1.2 inch × 1.3 inch PCB, which simplifies the connection to an existing processor system. The four mounting holes accommodate either M2 (2 mm) or Type 2-56 machine screws. These boards are made of IS410 material and are 0.063 inches thick. The second level assembly uses a SAC305-compatible solder composition (Pb-free), which has a presolder reflow thickness of approximately 0.005 inches. The pad pattern on the **ADIS16209/PCBZ** matches that shown in Figure 25. J1 and J2 are dual-row, 2 mm (pitch) connectors that work with a number of ribbon cable systems, including 3M Part Number 152212-0100-GB (ribbon-crimp connector) and 3M Part Number 3625/12 (ribbon cable).
